## Light Source II

Takashi TANAKA (RIKEN SPring-8 Center)

# Characteristics of SR (2)

- Electron Trajectory in the ID
- Qualitative Description of Wiggler Radiation
- Qualitative Description of Undulator Radiation

#### **Coordinate Systems**

SR emitted by an electron moving at  $\mathbf{r} = (x, y, z)$ Observation of SR at  $\mathbf{R} = (X, Y, Z)$ 

If the far-field approximation ( $|\mathbf{r}| < < Z$ ) is applicable, the radiation pattern depends only on the observation angle  $\theta = (\theta_x, \theta_y)$ .

#### **Field Integrals**

$$\frac{dP}{dt} = m\gamma \frac{dv}{dt} = -ev \times B \implies \begin{cases} m\gamma \dot{v_x} = -e(v_y B_z - v_z B_y) \\ m\gamma \dot{v_y} = -e(v_z B_x + v_x B_z) \end{cases}$$
Equation of motion of an electron moving in a magnetic field **B**

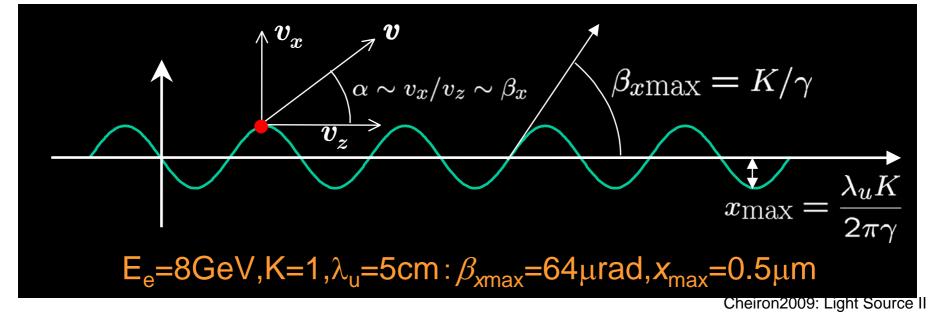

$$m\gamma \frac{dv_{x,y}}{v_z dt} = m\gamma \frac{dv_{x,y}}{dz} = \pm eB_{y,x}$$

$$\beta_{x,y} = \pm \frac{e}{\gamma mc} \int^{z} B_{y,x}(z') dz' \equiv \pm \frac{e}{\gamma mc} I_{1y,1x}(z)$$
$$x, y = \pm \frac{e}{\gamma mc} \int^{z} \int^{z'} B_{y,x}(z'') dz'' \equiv \pm \frac{e}{\gamma mc} I_{2y,2x}(z)$$

 $I_1, I_2$ : 1st and 2nd field integrals of the undulator

#### Trajectory in an Ideal Undulator

$$\begin{cases} B_x(z) = 0 \\ B_y(z) \sim B_0 \sin\left(\frac{2\pi z}{\lambda_u}\right) \end{cases} \begin{cases} \beta_y = 0 \\ \beta_x = \frac{K}{\gamma} \cos\left(\frac{2\pi z}{\lambda_u}\right) \end{cases} \begin{cases} y = 0 \\ x = \frac{\lambda_u K}{2\pi \gamma} \sin\left(\frac{2\pi z}{\lambda_u}\right) \end{cases}$$
  
magnetic field velocity position  
$$K = \frac{eB_0\lambda_u}{2\pi mc} = 93.37B_0(T)\lambda_u(cm)$$
  
K value, Deflection parameter

#### Effects due to the Undulator Field

#### **Electron Motion: Two Forms**

$$\beta_x = \frac{K}{\gamma} \cos\left(\frac{2\pi z}{\lambda_u}\right)$$

- Horizontal oscillation with a period of  $\lambda_u$
- Major contribution to radiation

$$\beta_z = \bar{\beta_z} - \frac{K^2}{4\gamma^2} \cos\left(\frac{4\pi z}{\lambda_u}\right)$$

- Longitudinal oscillation with a period of  $\lambda_u/2$
- Amplitude  $1/\gamma$  times lower than  $\beta_x$ .
- Minor contribution, but source of vertical polarization observed vertically off-axis.

## **General Form of Time Squeezing**

$$\frac{d\tau}{dt} = 1 - \beta \cdot n$$

$$\beta_z = \sqrt{\beta^2 - \beta_x^2 - \beta_y^2}$$

$$\sim 1 - (\gamma^{-2} + \beta_x^2 + \beta_y^2)/2$$

$$n_z \sim 1 - (\theta_x^2 + \theta_y^2)/2$$

$$= \frac{1}{2\gamma^2} + (\theta_x - \beta_x)^2 + (\theta_y - \beta_y)^2$$

Time squeezing takes place most significantly when the direction of the electron motion coincides with that of observation ( $\beta = \theta$ ).

# Characteristics of SR (2)

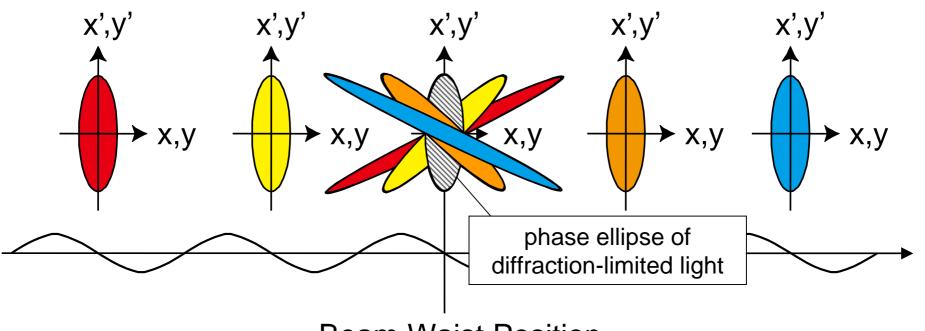

- Electron Trajectory in the ID
- Qualitative Description of Wiggler Radiation
- Qualitative Description of Undulator Radiation

## Wiggler Radiation

- Wiggler radiation (WR) is regarded as incoherent sum of SR at each position.
  - Summation as photons in the framework of geometrical optics.

Flux: 
$$F_W \sim 2NF_{BM}$$
  
Emittance:  $\sigma_{x',y'} \times \sigma_{x,y} \gg \lambda/4\pi$   
Brilliance:  $B_W \ll 2NB_{BM}$ 

## Photon Distribution in Phase Space

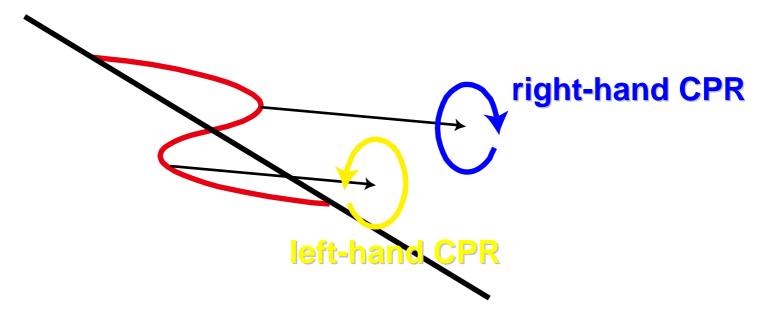

**Beam Waist Position** 

- Larger N results in larger area of photon distribution in the phase space, i.e., larger emittance.
- B does not linearly depend on N

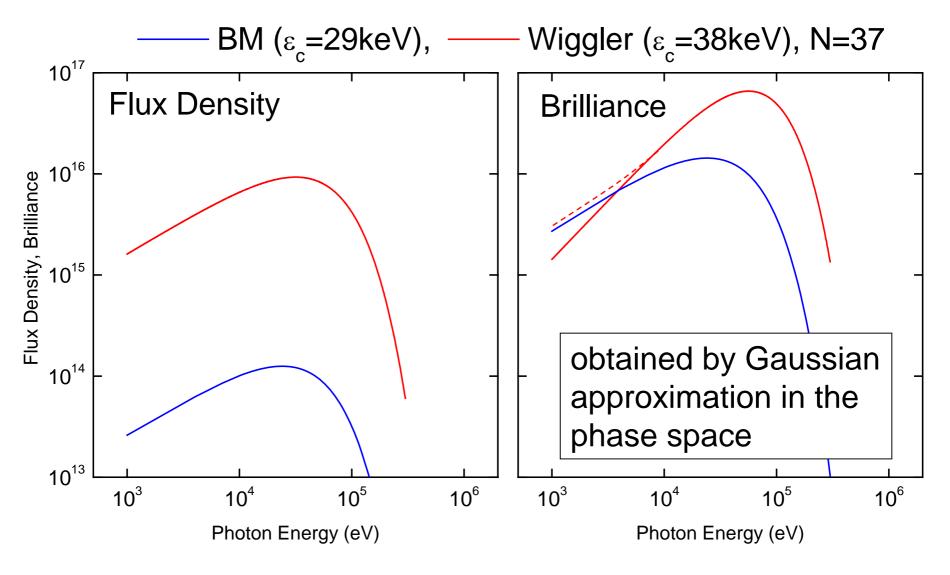

#### Polarization

 No circular polarized radiation (CPR) is observed unlike the BM radiation even off axis, due to cancellation of CPR components.

• EMPW is a special wiggler to utilize CPR by introducing a vertical motion.

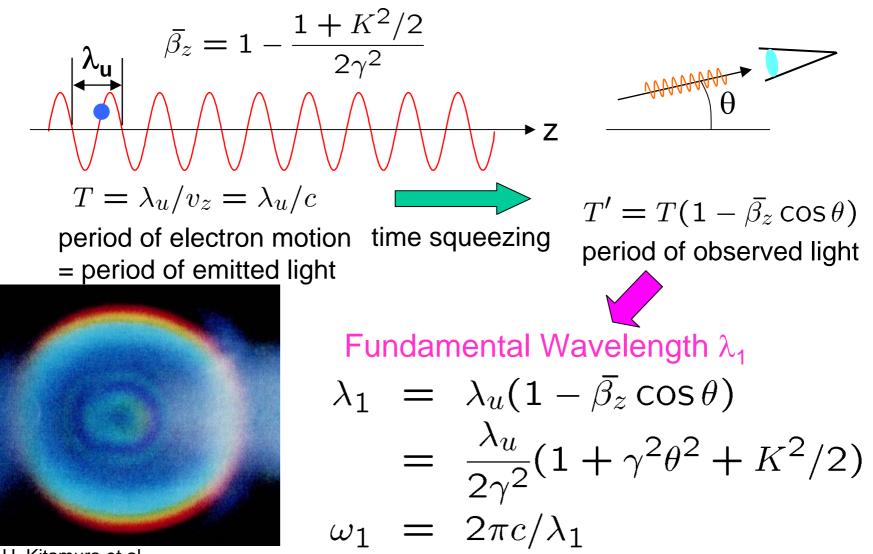

#### **Comparison with BM Radiation**

# Characteristics of SR (2)

- Electron Trajectory in the ID
- Qualitative Description of Wiggler Radiation
- Qualitative Description of Undulator Radiation

#### **Fundamental Wavelength**

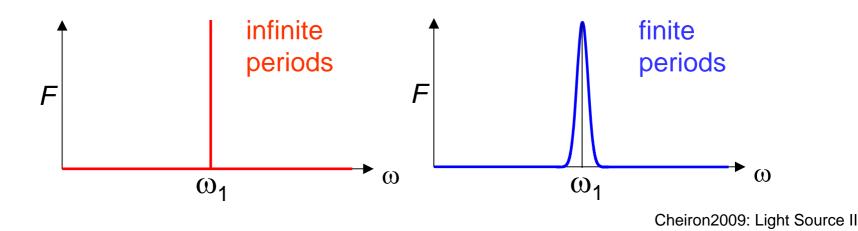

H. Kitamura et al., J. Appl. Phys. 21 (1982) 1728

# UR with Infinite Periods

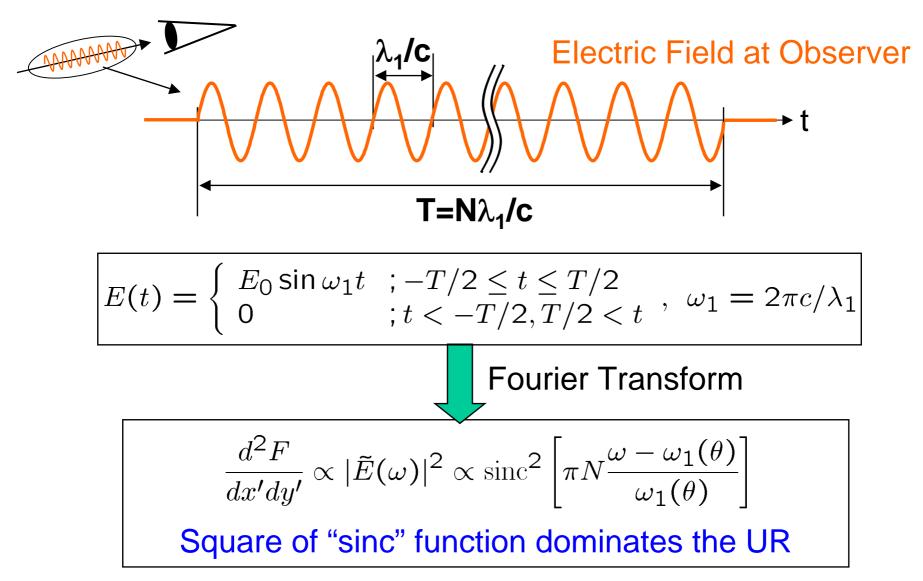

• If the undulator length is infinite, the pulse duration is infinitely long, and thus the radiation is completely monochromatic with line spectrum.

$$\frac{d^2F}{dx'dy'} \propto \delta(\omega - \omega_1) = \delta\left(\omega - \frac{4\pi c\gamma^2/\lambda_u}{1 + K^2/2 + \gamma^2\theta^2}\right)$$

• In practice, the undulator length is finite, so the line spectrum is broadened.

#### Effects due to Finite Periods

# Brief Note on UR Formulae

- In the previous derivations of UR spectral function, no knowledge on electrodynamics is required.
- In practice, *E<sub>0</sub>* is a complicated function of *θ* and *K*, and needs to be calculated by Fourier transforming the electric field derived from the Lienard-Wiecherd potential.
- However, the simple derivation gives us a clear understanding on UR properties.

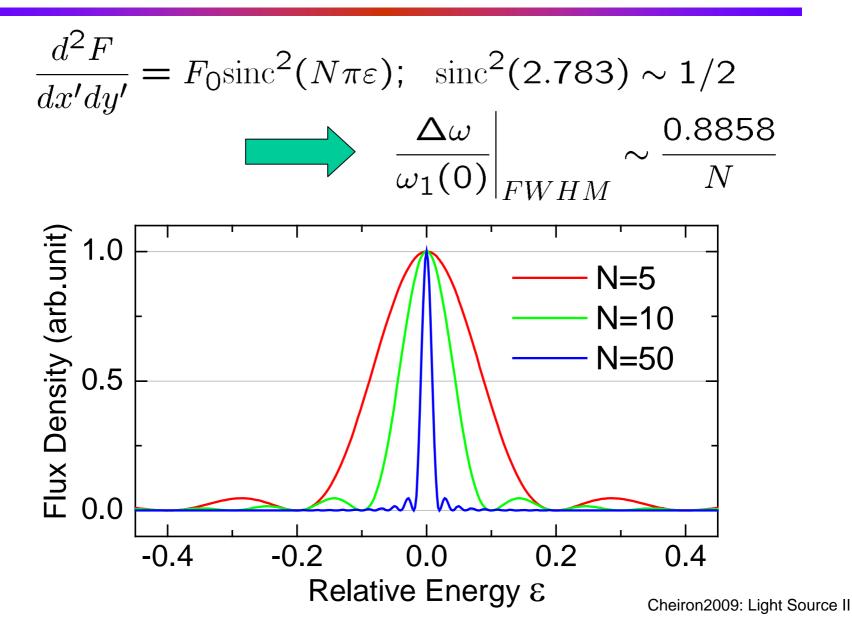

## Energy and Angular Profile of UR

$$\frac{d^2 F(\omega, \theta)}{d\Omega d\omega/\omega} = F_0 \text{sinc}^2 \left[ \pi N \frac{\omega - \omega_1(\theta)}{\omega_1(\theta)} \right]$$

Energy Profile at  $\theta = 0$   $F_0 \text{sinc}^2 (N\pi\varepsilon)$ ;  $\varepsilon = [\omega - \omega_1(0)]/\omega_1(0)$ 

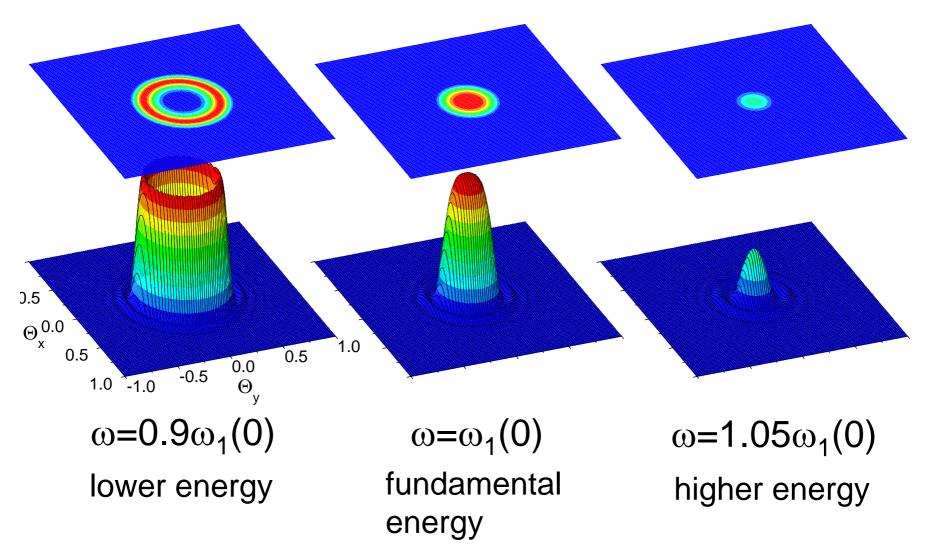

Angular Profile at  $\omega = \alpha \omega_1(0)$   $F_0 \text{sinc}^2 [N\pi(\alpha \Theta^2 + \alpha - 1)]$ ;  $\Theta = \gamma \theta / \sqrt{1 + K^2/2}$ 

## **Energy Profile: Example**

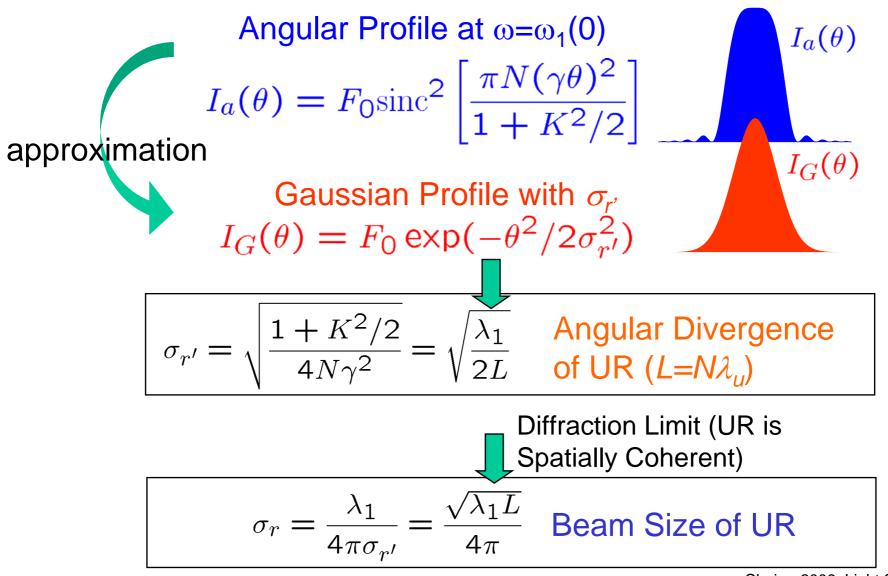

Qualitative Descriptions of UR

#### Angular Profile: Example

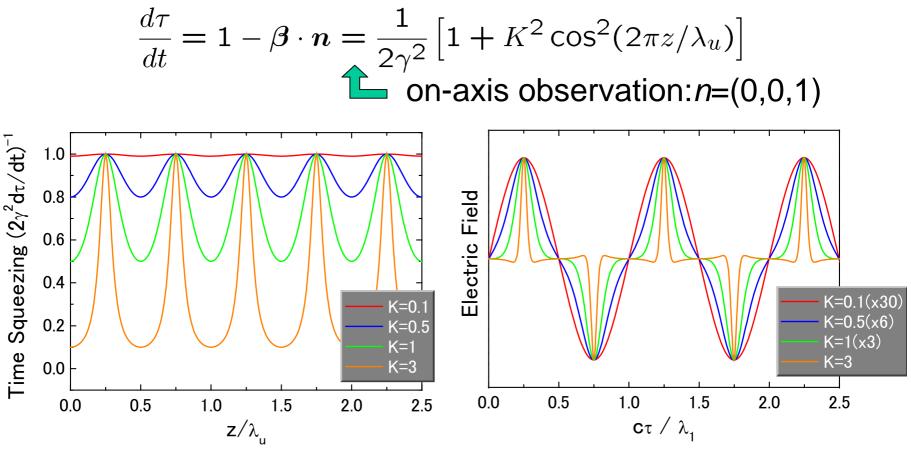

#### Angular Divergence and Beam Size

## **Higher Harmonics**

- In addition to the fundamental radiation at ω<sub>1</sub>, higher-energy radiation at nω<sub>1</sub>, called higher harmonics, is observed. The integer n is referred to as a harmonic number.
- This is a consequence of the fact that the time-squeezing factor depends on the longitudinal electron position and thus the electric field in the time domain is distorted.

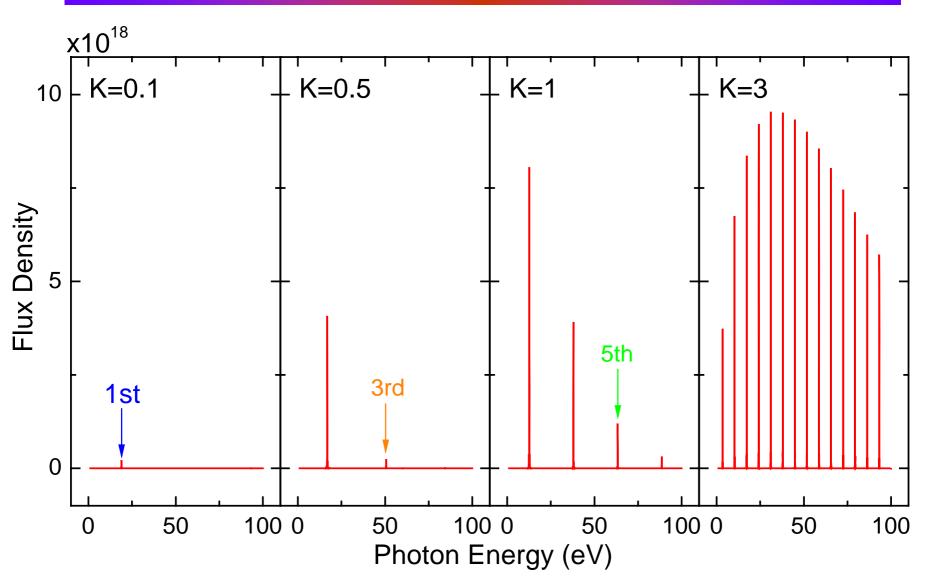

#### **Interpretation of Higher Harmonics**

Large K value brings a modulation in the time squeezing factor

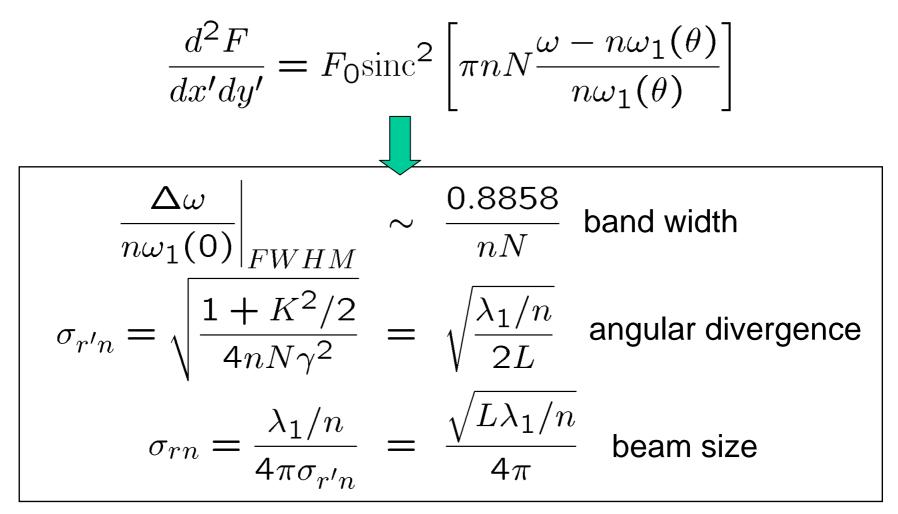

Distortions of the electric field takes place due to the nonuniform time squeezing. Due to symmetry, even harmonics do not appear.

#### **Examples of Higher Harmonics**

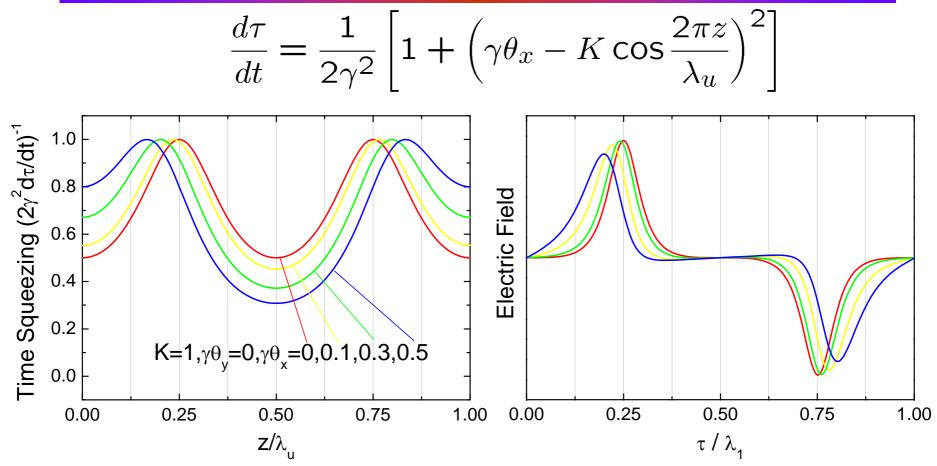

### **Optical Properties of Higher Harmonics**

For the n-th harmonic radiation,

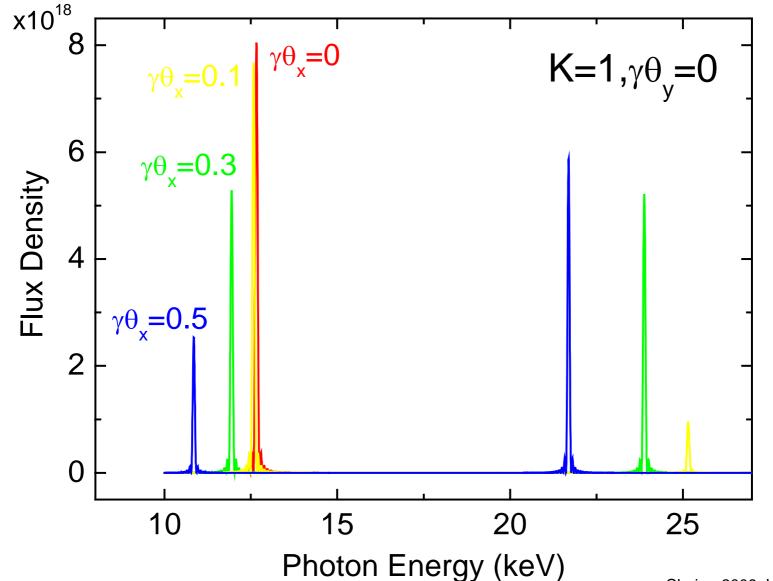

#### **Even Harmonics Horizontally Off Axis**

The position for the maximum time squeezing is shifted due to finite  $\theta_x$ .

The symmetry of the electric field is broken, resulting in appearance of even harmonics.

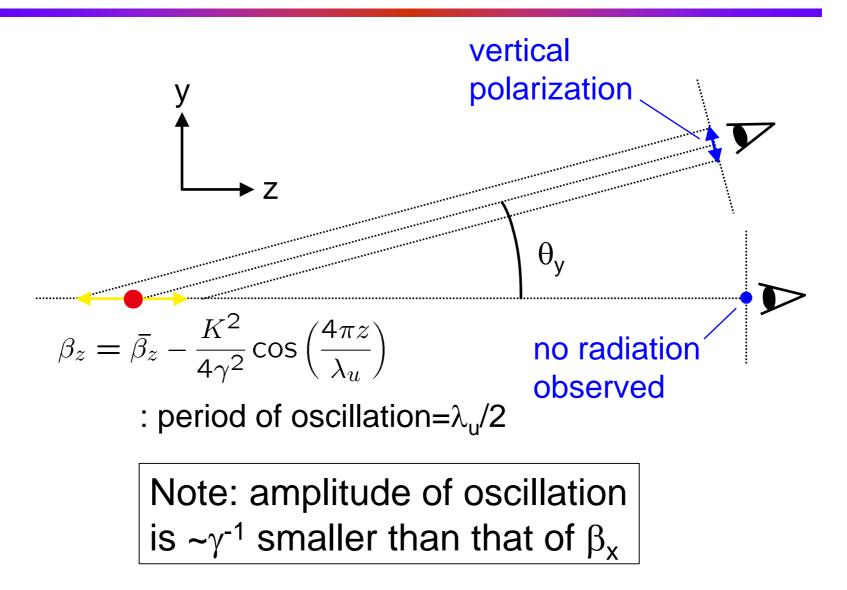

#### **Examples of Even Harmonics**

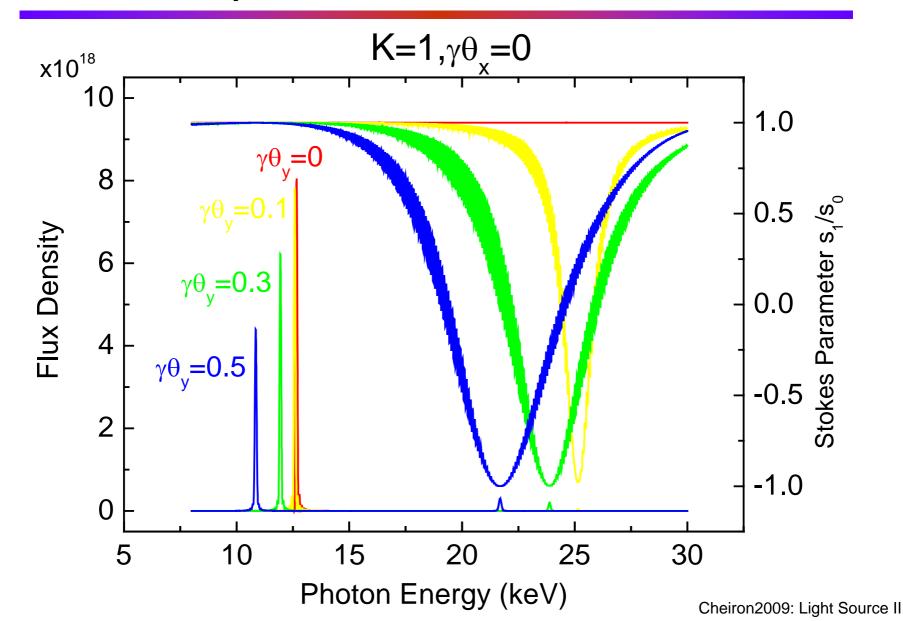

## Even Harmonics Vertically Off Axis

- Vertically off-axis observation does not break the symmetry of the E-field.
- Nevertheless, even harmonics are observed due to the longitudinal oscillation in electron motion with a period of  $\lambda_u/2$ .
- Such even harmonics are vertically polarized, reflecting the electron motion projected onto the plane of observation.

### Mechanism of Vertical Polarization

#### **Example of Vertical Polarization**

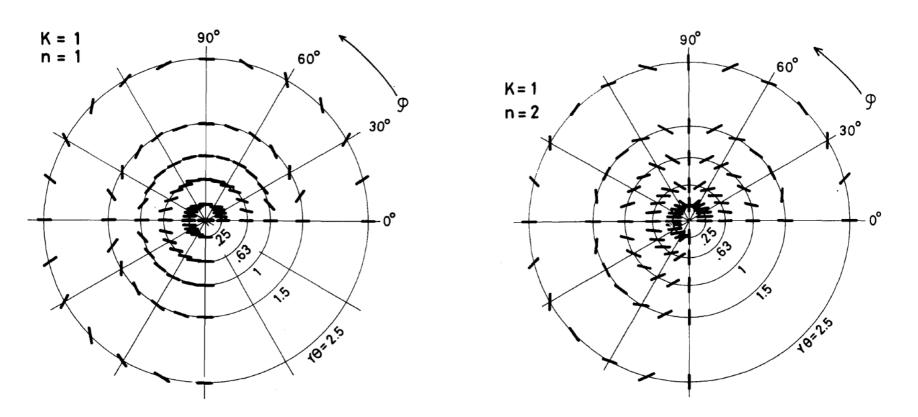

### Polarization

- As in the wigglers, no circular polarized radiation (CPR) is observed due to cancellation of CPR components.
- The direction of the linear polarization observed off axis is tilted due to the longitudinal oscillation of electron motion.

#### **Polarization: Examples**

Examples of the direction of linear polarization for various observation angles.

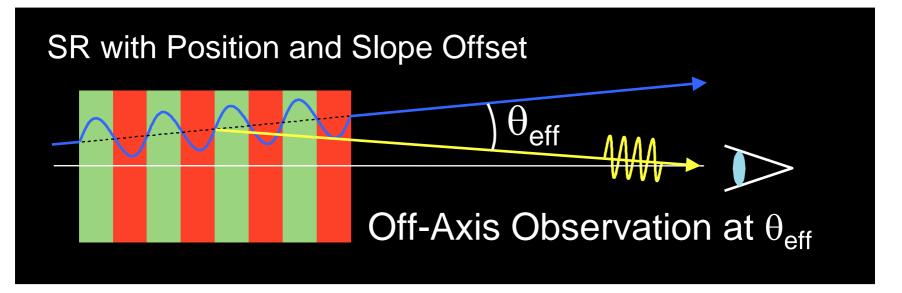

H. Kitamura, JJAP 19 (1980) L185

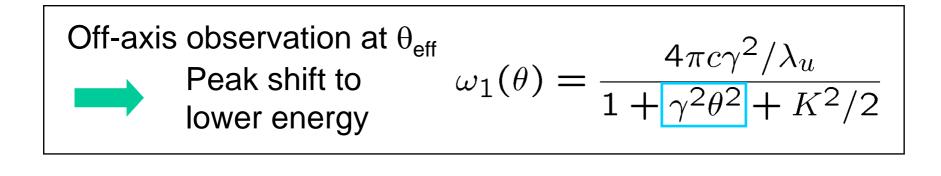

#### Practical Knowledge on SR

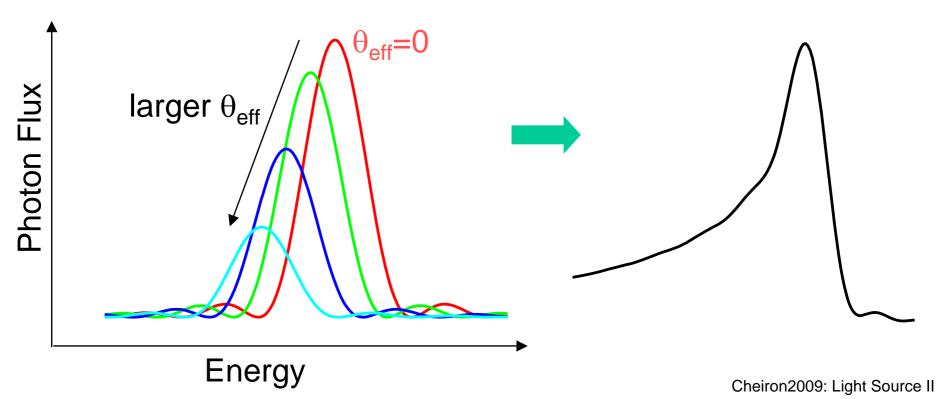

# Effects due to Finite Emittance (1)

- Effects due to Finite Emittance of the Electron Beam
  - Injection to the undulator with angular and positional offset

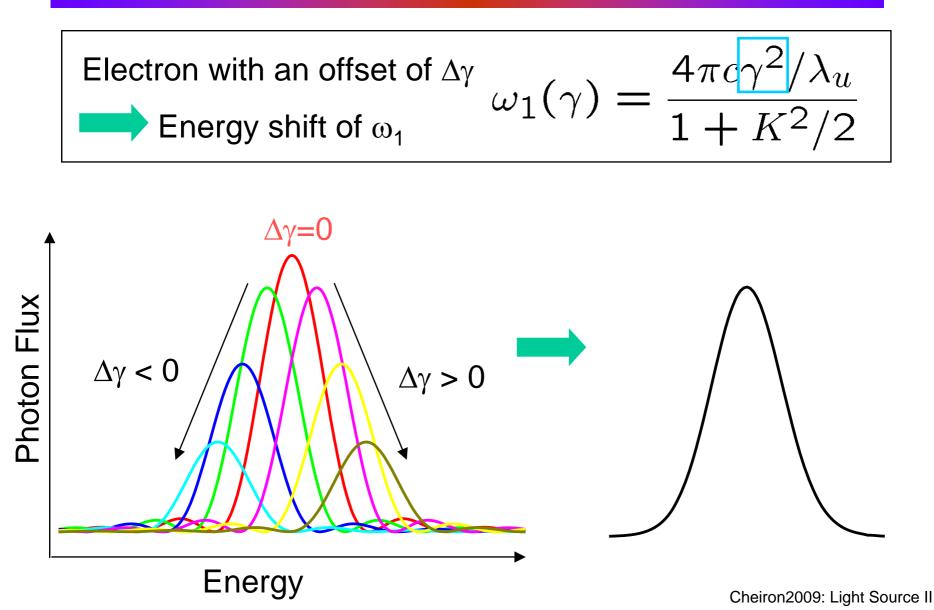

## Effects due to Finite Emittance (2)

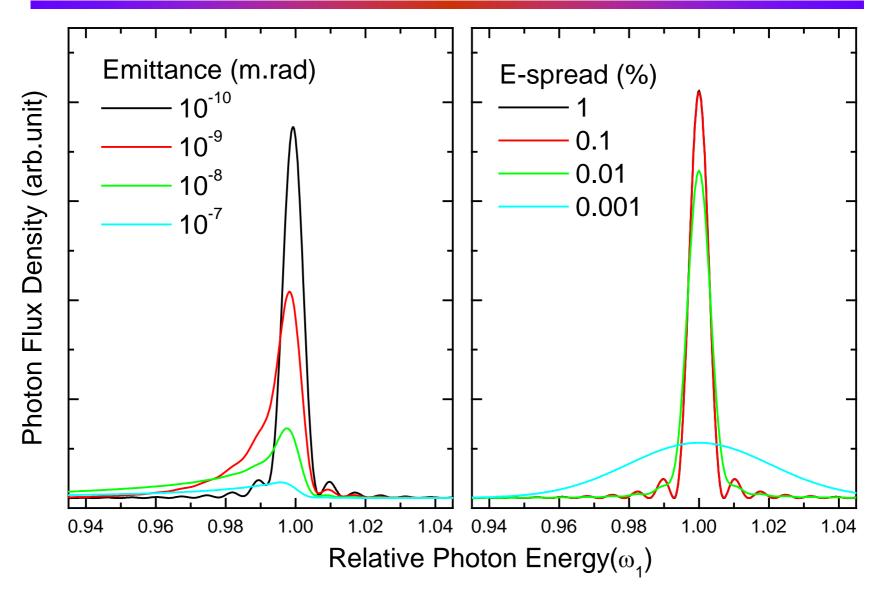

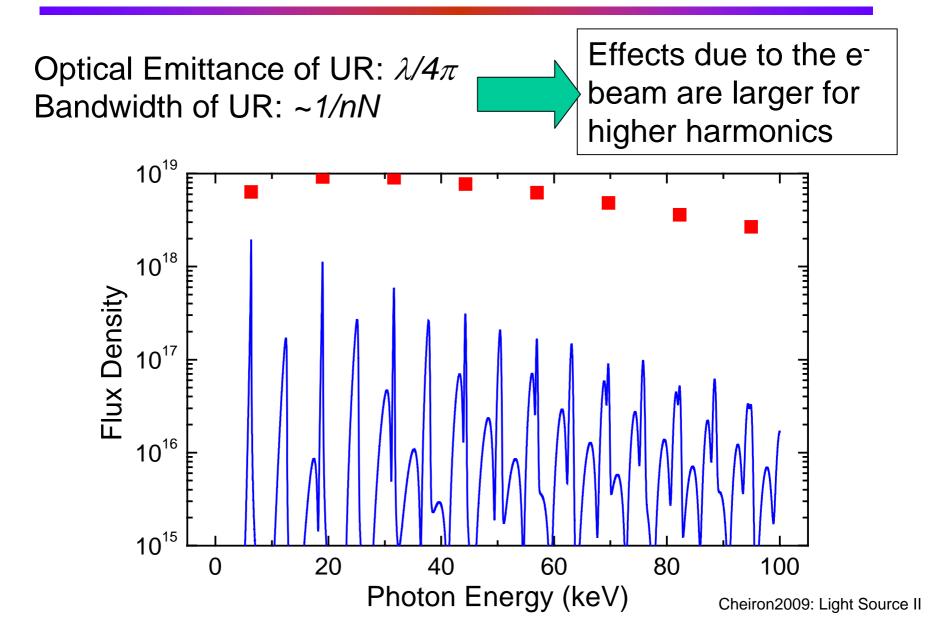

## Effects due to the Energy Spread

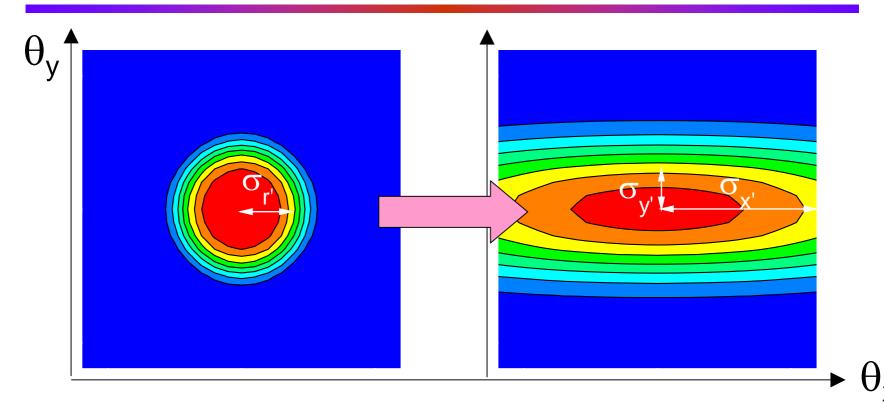

## Effects on the Higher Harmonics

### Effective Beam Size and Divergence

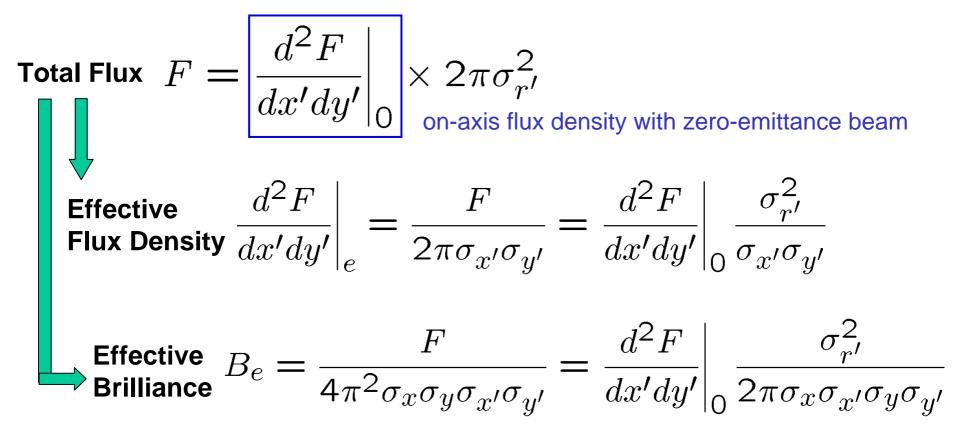

**Under Gaussian approximation** 

$$\sigma_{x',y'} = \sqrt{\sigma_{r'}^2 + \sigma_{ex',ey'}^2}, \quad \sigma_{x,y} = \sqrt{\sigma_r^2 + \sigma_{ex,ey}^2}$$
  
\*effective beam size \*effective divergence

\*Note: Valid only near the resonance energy  $(n\omega_1)$ .

## Effective Flux Density and Brilliance

Simple scheme to estimate the on-axis flux density and brilliance.

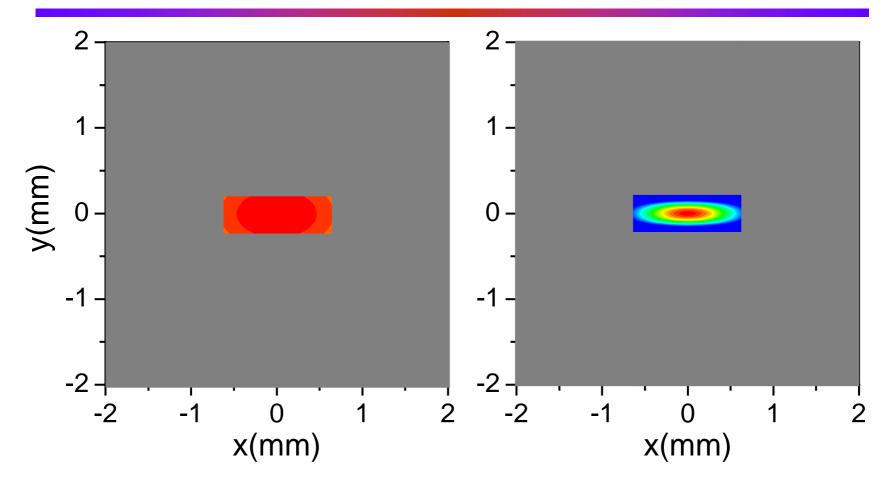

Cheiron2009: Light Source II

## Heat Load on Optical Elements

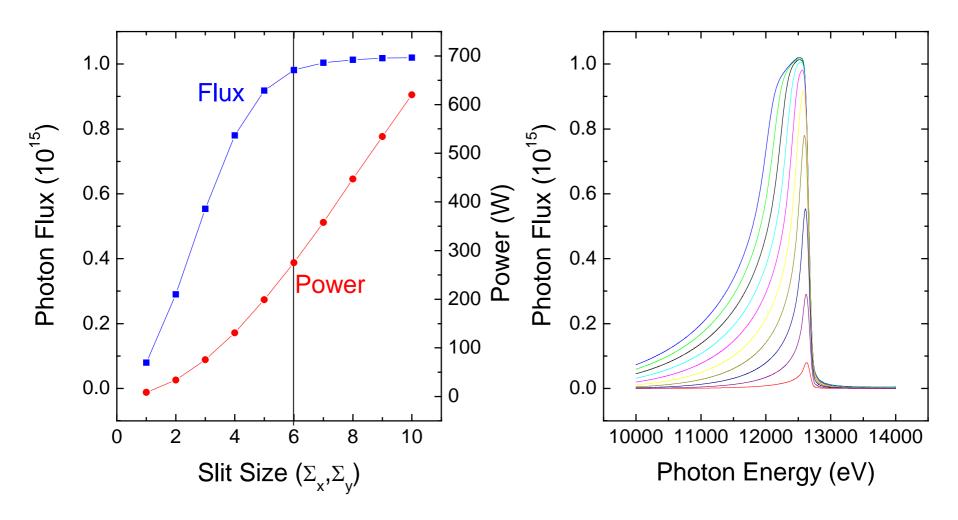

- SR emitted from the light source is processed by several optical elements before irradiation to the sample, such as the focusing mirror, monochromator.
- These elements can be easily damaged by the heat load brought by the SR.
- It is thus important to reduce the heat load as much as possible without sacrificing the flux, which is actually done by the XY slit at the front-end section.

### Spatial Profile of Power and Flux

The power profile is much broader than the flux. Extraction of SR with an appropriate slit significantly reduces the heat load.

#### **Optimum Slit Size?**

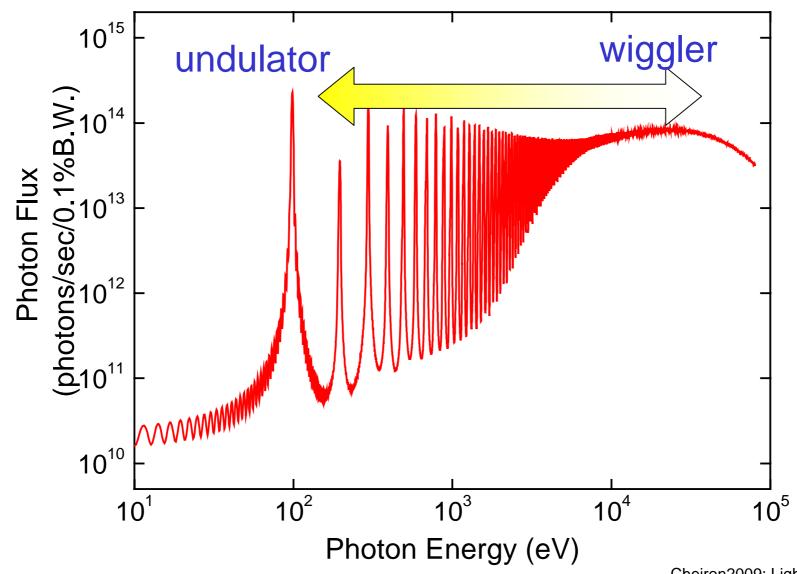

# Wiggler? Undulator? (1)

- Wigglers are identical to undulator from the point of view of magnetic circuit.
- It is generally said that the K value distinguishes between the two, however, this is not exactly correct.
- What we should take care is the region of photon energy to be utilized for application.

Practical Knowledge on SR

## Wiggler? Undulator? (2)

# **Other Topics Not Addressed**

- Quantitative descriptions of SR
- Light sources for circular polarization and schemes for fast helicity switching
  - helical undulator & elliptic wiggler
  - chicanes&choppers, kicker magnets
- Effects on the electron beam
  - natural focusing
  - beam-axis fluctuation due to COD variation
- R&Ds toward shorter magnetic period
  - superconducting undulators
  - cryogenic permanent magnet undulators
- Coherent SR for intense THz light
- Undulators for SASE-based X-ray FEL
